Practice03: List

Question01

Create a list that contains the blood pressure values of 10 patients. Then, separate the values into two new lists.

- one list for blood pressures greater than or equal to 130,
- and another list for those below 130.

Question02

Create a list that contains the BMI values of five patients, and write a program that finds and displays the index and value of both the highest and the lowest BMI in the list.

Question03

Create a list that contains the blood sugar levels of ten patients, and write a program that calculates the average blood sugar and then displays the index and value of all patients whose blood sugar is higher than the average.

Good luck
