Practice08: Exception, Files

Question01

Write a Python program that asks the user for an index number and tries to print the element at that index from a list. Use a **try / except block** to handle the case where the index is out of range.

Question02

Write a Python program that asks the user for a number. If the number is negative, raise a custom exception with a message like **“Negative numbers are not allowed”.**

Question03

Write a Python program that asks the user to enter an index number. Create a list like **my_list = [10, 20, 30]**. The program should try to convert the user's input to an integer, and if the input is not a valid number, handle the **ValueError**.Then, try to access the element at that index and handle the **IndexError** if the index is out of range. If no error happens at all, use an **else block** to print the selected element.

Question04

Write a Python program that asks the user for the name of a **.txt** file. If the file exists, print its content. If the file does not exist, create it and write a sample text inside it.

Good luck
