Practice09: Files, numpy

Question01

Write a Python program that performs the following tasks:

- Ask the user to enter the path of a directory.
- Scan the directory and find all the files inside it.
- For each file extension that exists in the directory, create a new folder.
  - The folder name must follow the pattern: folder_<extension>
  - For example, all files with the .py extension should be moved into a folder named folder_py.
- Move each file into the folder that corresponds to its extension.

Question02

Please, with an example, show that NumPy is faster than Python lists.

Good luck
