Practice11: Pandas

Question01

Write a Python program using Pandas to perform the following tasks:

- Read the data from a CSV file and store it in a DataFrame.
- Find all missing (null) values and fill them using an appropriate method.
- For all numerical columns excluding those that contain only binary values (0 and 1), calculate and display:
  - maximum value
  - minimum value
  - mean value
- For columns that contain only binary values (0 and 1), calculate:
  - the number of values equal to 0
  - the number of values equal to 1

Question02

- Create a new column named risk_level based on the values of the avg_glucose_level column using the following rules:
  - avg_glucose_level < 100 → "Low"
  - 100 ≤ avg_glucose_level < 140 → "Medium"
  - avg_glucose_level ≥ 140 → "High"
- Convert the risk_level column into numerical values using mapping as follows:
  - "Low" → 0
  - "Medium" → 1
  - "High" → 2

Good luck
